ND = not detected below 1.0 parts per billion (ppb) for Total Chromium

\* All pumping station samples are collected where the water enters the distribution system. The water from this sampling point can therefore be a mixture of all well pumps operating at the time of sampling.

According to the State Department of Health, the chromium VI results are within the expected range of naturally occurring levels for Hawaii and are not indicative of industrial contamination. The Board of Water Supply continues to meet all federal and state drinking water standards, and Oahu's tap water is safe for human consumption.
